## MBF 3C1

## Name:

$\qquad$

## UNIT 3 SURVIVAL GUIDE: Exponential Relations

| EXPONENT LAWS |
| :--- | :--- | :--- |
| Multiplication <br> Law like bases being multiplied, _- <br> exponents $\left(3^{2}\right)\left(3^{4}\right)=$ <br> Division Law like bases being divided, <br> exponents $3^{6} \div 3^{2}=$ <br> Power of a <br> Power Law power raised to an exponent, <br> exponents $\left(3^{2}\right)^{5}=$ <br> Zero Law anything raised to the exponent <br> zero equals _ $3^{0}=$ <br> Negative <br> Exponent Law flip the base to it's__ <br> and change the exponent to it's $\left(3^{2}\right)\left(3^{-4}\right)=$ |

Power of a Product/Quotient $\rightarrow$ distribute the exponent to each base
$\left(3 x^{2}\right)^{3}=$
$\left(x^{2} / 3\right)^{3}=$

## Exponential Relationships

- exponential growth occurs when the relationship is $\qquad$ (up to right) and $b$ represents the $\qquad$ _

- exponential decay occurs when the relationship is $\qquad$ (down to right) and $b$ represents the $\qquad$ -

- exponential relations do not have $x$-intercepts because exponential relations will $\qquad$ and solve for $y$

## Characteristics of Exponential Relations

- an exponential equation is in the form $\qquad$ , where $a=$ $\qquad$
$b=$ $\qquad$
- the table of values of an exponential relation has a $\qquad$ which can be determined by dividing consecutive $y$-values ( $y_{2} \div y_{1}, y_{3} \div y_{2}, y_{4} \div y_{3}$, etc.)

| $x$ | $y$ | CR |
| :---: | :---: | :---: |
| 0 | 1 | $2 \div 1=2$ |
| 1 | 2 | $4 \div 2=2$ |
| 2 | 4 | $8 \div 4=2$ |
| 3 | 8 | $16 \div 8=2$ |
| 4 | 16 |  |

- the graph of an exponential relation is nearly $\qquad$ at one end and either increases/decreases $\qquad$ at the other

## Solving Problems with Exponential Relations

1. start with the generalization for exponential relations ( $\qquad$ _)
2. sub in the $\qquad$ (a)
3. sub in the $\qquad$ (b)
$\star$ for double use $\qquad$ , for half-life use $\qquad$ for triple use $\qquad$ etc
$\star$ for \% growth rate, $\qquad$ -
$\star$ for \% decay rate, $\qquad$
Example: A principal of $\$ 100$ is invested at $12 \%$ per year, compounded annually.
a. Write an exponential equation to represent the relationship.

$$
y=a b^{x}
$$

$$
y=
$$

b. What will the investment be worth in 25 years?
